

ABSTRACT

A data processing device programmed for creating and distributing financial information equipped with at least one network-compatible interface. At least one interface can be connected to a dynamic number of customer systems such that at least one interface can be used to transmit financial information to the customer systems from the data processing device at any time, and conversely to transmit lists containing key values and parameters to the data processing device from the customer systems, the supply files and/or supply data streams created, including inventory and/or delta data elements.
